

Consensus Statements and Guidelines

This section provides information on consensus findings from leading international and national researchers and physicians in the field of carcinoid and neuroendocrine tumors.

The North American Neuroendocrine Tumor Society (NANETS) Guidelines

The publication of the first **North American consensus guidelines for NET disease management** was a major achievement for the carcinoid/NET community in 2010. These guidelines include early detection procedures for diagnostic purposes, imaging, histopathology, biochemical evaluation, surgical procedures, and evidence-based treatments emphasizing a multidisciplinary team-based approach to patient care. The NANETS Guidelines Working Group consists of 38 carcinoid/NET specialists writing guidelines in the areas of Epidemiology and Genetics, Pathology, Radionuclide Therapies, Biochemistry, Symptomatic Control, Surgery, Imaging and Liver-Directed Therapies, Systemic Treatments, and Follow-up. The guidelines have been published in **Pancreas**, Volume 39, Number 6, August 2010. They are as follows:

Abstract: These guidelines update previous guidance published in 2005. They have been revised by a group who are members of the UK and Ireland Neuroendocrine Tumour Society with endorsement from the clinical committees of the British Society of Gastroenterology, the Society for Endocrinology, the Association of Surgeons of Great Britain and Ireland (and its Surgical Specialty Associations), the British Society of Gastrointestinal and Abdominal Radiology and others. The authorship represents leaders of the various groups in the UK and Ireland Neuroendocrine Tumour Society, but a large amount of work has been carried out by other specialists, many of whom attended a guidelines conference in May 2009. We have attempted to represent this work in the acknowledgements section. Over the past few years, there have been advances in the management of neuroendocrine tumours, which have included clearer characterisation, more specific and therapeutically relevant diagnosis, and improved treatments. However, there remain few randomised trials in the field and the disease is uncommon, hence all evidence must be considered weak in comparison with other more common cancers.

- Recommendations for radioembolization of hepatic malignancies using Yttrium-90 microsphere brachytherapy.

[A consensus panel report from the radioembolization brachytherapy oncology consortium](#) (Full text PDF)

Int. J. Radiation Oncology Biol. Phys., Vol. 68, No. 1, pp. 13-23, 2007

PURPOSE: To standardize the indications, techniques, multimodality treatment approaches, and dosimetry to be used for yttrium-90 (Y90) microsphere hepatic brachytherapy.

METHODS AND MATERIALS: Members of the Radioembolization Brachytherapy Oncology Consortium met as an independent group of experts in interventional radiology, radiation oncology, nuclear medicine, medical oncology, and surgical oncology to identify areas of consensus and controversy and to issue clinical guidelines for Y90 microsphere brachytherapy.therapies.

CONCLUSIONS: Yttrium-90 microsphere therapy is a complex procedure that requires multidisciplinary management for safety and success. Practitioners and cooperative groups are encouraged to use these guidelines to formulate their treatment and dose-reporting policies.

- Guidelines for the Management of Gastroenteropancreatic Neuroendocrine Tumours (Including Bronchopulmonary and Thymic Neoplasms)

Members of Nordic the NE Tumour Group: Öberg K, Astrup L, Eriksson B, Falkmer UG, Gustafsen J, Haglund C, Knigge U, Vatn M H and Välimäki M.
Acta Oncologica Vol.43, No 7, 2004

Part I-general overview (pp. 617-625) [Full Text](#)

The incidence of neuroendocrine tumours of the gastroenteropancreatic system seems to have increased during the past decade. New diagnostic and therapeutic procedures have aroused the interest of physicians, though most see very few cases of such diseases. A group of members of the Nordic Neuroendocrine Tumour Group decided to compile some guidelines to facilitate the diagnosis and treatment of patients with these tumours. Part I of these guidelines discusses the principles of histopathology, biochemical and radiological diagnosis as well as therapeutic options.

Part II-specific NE tumour types (pp 626-636) [Full Text](#)

Part II of the guidelines contains a description of epidemiology, histopathology, clinical presentation, diagnostic procedure, treatment, and survival for each type of neuroendocrine tumour. We are not only including gastroenteropancreatic tumours but also bronchopulmonary and thymic neuroendocrine tumours. These guidelines essentially cover basic knowledge in the diagnosis and management of the different forms of neuroendocrine tumour. We have, however, tried to give more updated information about the epidemiology and histopathology, which is essential for the clinical management of these tumours.

- [Consensus Report on the Use of Somatostatin Analogs for the Management of Neuroendocrine Tumors of the Gastroenteropancreatic System](#) (PDF Full text)

By K. Öberg, L. Kvols, M. Caplin, G. Delle Fave, W. de Herder, G. Rindi, P. Ruzsniowski, E. A. Woltering, and B. Wiedenmann
Annals of Oncology 15: 966-973, 2004

This consensus report gives a detailed description of the use of somatostatin analogs in the management of neuroendocrine tumors of the gastroenteropancreatic system. As background information we have outlined critical aspects of the pathology, the use of tumor markers, a definition of functional and non-functional digestive neuroendocrine tumors, different imaging modalities, surgical considerations, liver embolization and the use of cytotoxic drugs as well as interferon. Included in the report is an overview of somatostatin, somatostatin analogs and its receptor expression in different neuroendocrine tumors. It will also define the binding affinities of different somatostatin analogs to the five different subtypes of somatostatin receptor. We compare the

Consensus Statements and Guidelines

Published on The Carcinoid Cancer Foundation (<http://www.carcinoid.org>)

efficacy of octreotide and lanreotide in reducing diarrhea and flushing. Side-effects are described and we provide practical information on somatostatin analog treatment.

By J. Ricke, K., J. Klose, M. Mignon, K. Öberg, and B. Wiedenmann
European Journal of Radiology, Volume 37, Issue 1, January 2001, Pages 8-17

Diagnostic imaging; Multiple endocrine neoplasia; Neuroendocrine tumours

In 1998 and 1999, a delphi consensus procedure was performed to establish guidelines for standardised diagnostic imaging of neuroendocrine tumours. The procedure included four consecutive workshops of a European group of experts in neuroendocrine tumours as well as feedback given by specialists from the departments of radiology, nuclear medicine, surgery and internal medicine of the according home institutions. Diverging approaches among the centres, which became apparent during the discussion, reflect a lack of controlled studies specifically for rare subgroups of neuroendocrine tumours. This paper summarises the standards for diagnostic imaging as developed during the delphi process. In particular, the diagnostic workflows as well as the technical properties of different imaging modalities are described in detail.
